

## Graphite Grease

Grease produced using graphite dust particles. It's thanks to these particles that graphite grease effectively reduces friction and conducts electricity, which is particularly characteristic of this lubricant.

### Application:

Graphite Grease is intended for lubricating slow-speed mechanisms and heavily loaded sliding surfaces operating within a temperature range of  $-20^{\circ}\text{C}$  to  $60^{\circ}\text{C}$ . This grease can be used for lubricating leaf springs, screw threads, chains, open gears, and worm gears.
